Hypertrophic cardiomyopathy?

Presence of increased left ventricular (LV) wall thickness that is not solely explained by abnormal loading conditions.

In an adult ≥15 mm in one or more LV myocardial segments—by any imaging technique

- ~ **In relatives ≥13 mm**
- ~ **Genetic & nongenetic disorders 13–14 mm**

In children > 2 SD of the predicted mean **(z-score >2)**

Elliott et al. Eur Heart J. 2014 Oct 14;35(39):2733-79.

Prevalence of diagnosed HCM in Germany (2015)[1]

- 4,000 out of 5,490,810 patients (0.07%; 1:1,372)
- average age 63±17 years (median 66 years),
- 2,586 (65%) were male.

Prevalence lower as compared to original echo-based data from Coronary Artery Risk Development in (Young) Adults (CARDIA) Study[2]

- **4111 men and women 23 to 35 years of age selected from the general population**
- **7 (0.17%) fulfilled the criteria for HCM**
- **Prevalence in men and women was 0.26:0.09%;**
- **Prevalence in blacks and whites 0.24:0.10%**

SPECIAL ARTICLE

Diagnostic work-up in cardiomyopathies: bridging the gap between clinical phenotypes and final diagnosis. A position statement from the ESC Working Group on Myocardial and Pericardial Diseases

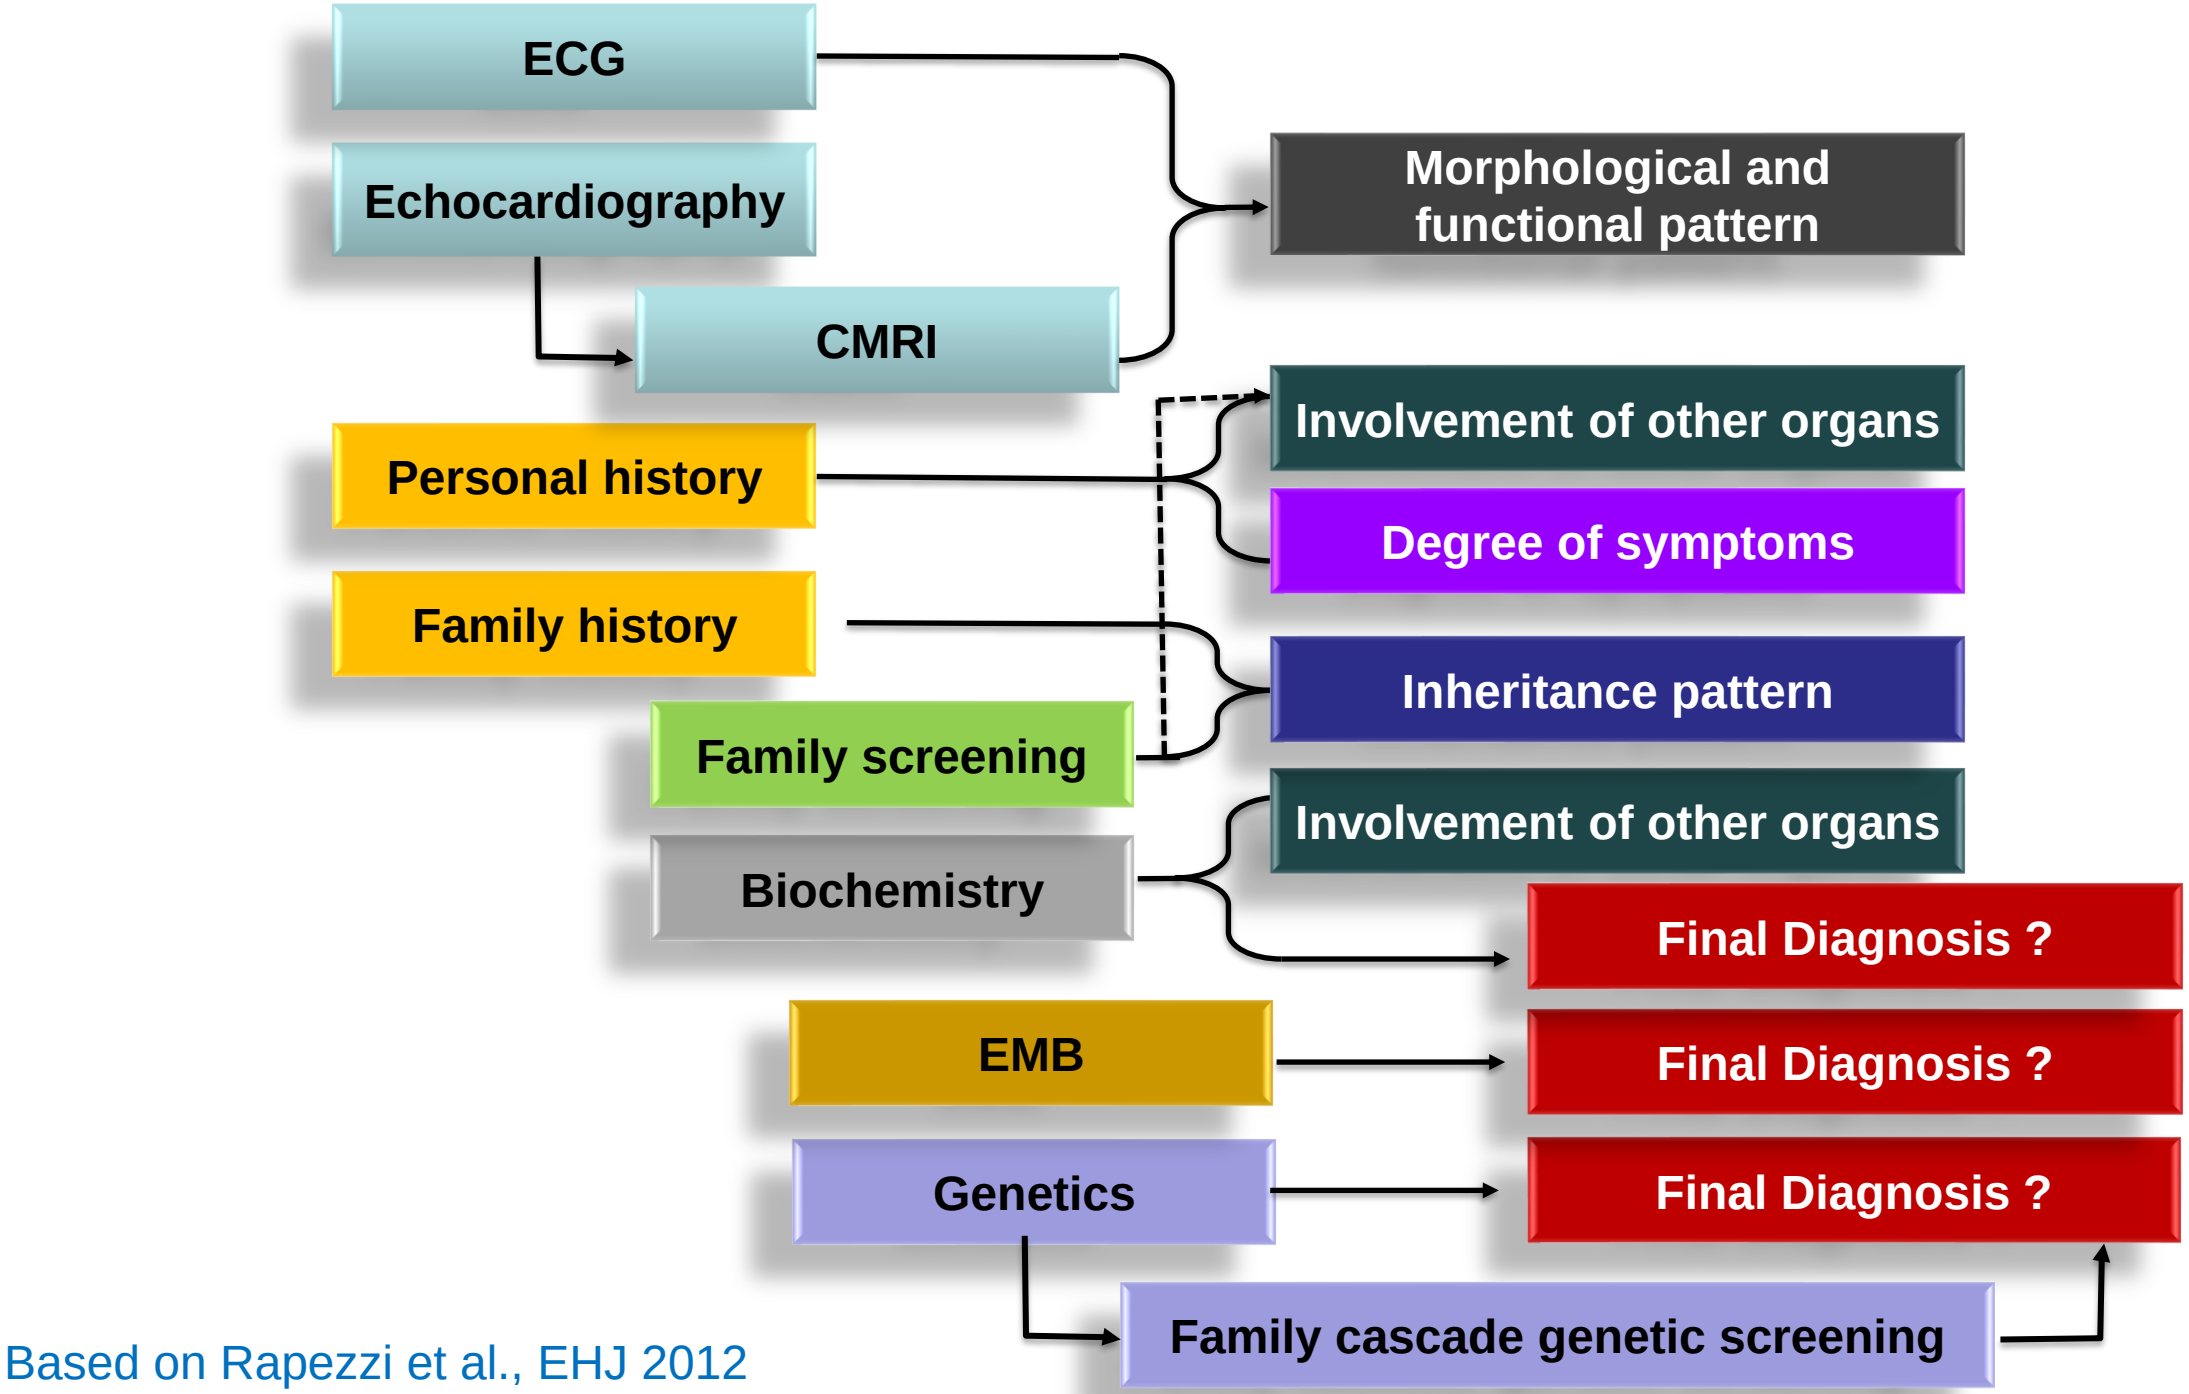
Claudio Rapezzi, Eloisa Arbustini, Alida L. P. Caforio, Philippe Charron, Juan Gimeno-Blanes, Tiina Heliö, Ales Linhart, Jens Mogensen, Yigal Pinto, Arsen Ristic, Hubert Seggewiss, Gianfranco Sinagra, Luigi Tavazzi, and Perry M. Elliott*

The Heart Hospital, 16–18 Westmoreland Street, London W1G 8PH, UK

Received 6 May 2012; revised 3 September 2012; accepted 20 September 2012

In 2008, The ESC Working Group on Myocardial and Pericardial Diseases proposed an updated classification of cardiomyopathies based on morphological and functional phenotypes and subcategories of familial/genetic and non-familial/non-genetic disease. In this position statement, we propose a framework for the clinical approach to diagnosis in cardiomyopathies based on the recognition of diagnostic 'red flags' that can be used to guide rational selection of specialized tests including genetic analysis. The basic premise is that the adoption of a cardiomyopathy-specific mindset which combines conventional cardiological assessment with non-cardiac and molecular parameters increases diagnostic accuracy and thus improves advice and treatment for patients and families.

Keywords Cardiomyopathy • Diagnosis • Phenotype • Genotype



Based on Rapezzi et al., EHJ 2012

Patient´s trajectory in cardiology practice

Symptoms

- Heart failure
- Arrhythmias
- Syncope
- Sudden death

Asymptomatic

- Screening (ECG, ECHO)

HCM diagnosis in a relative

Author´s own opinion

STEP 1: HYPETROPHY

HCM – genetic testing negative

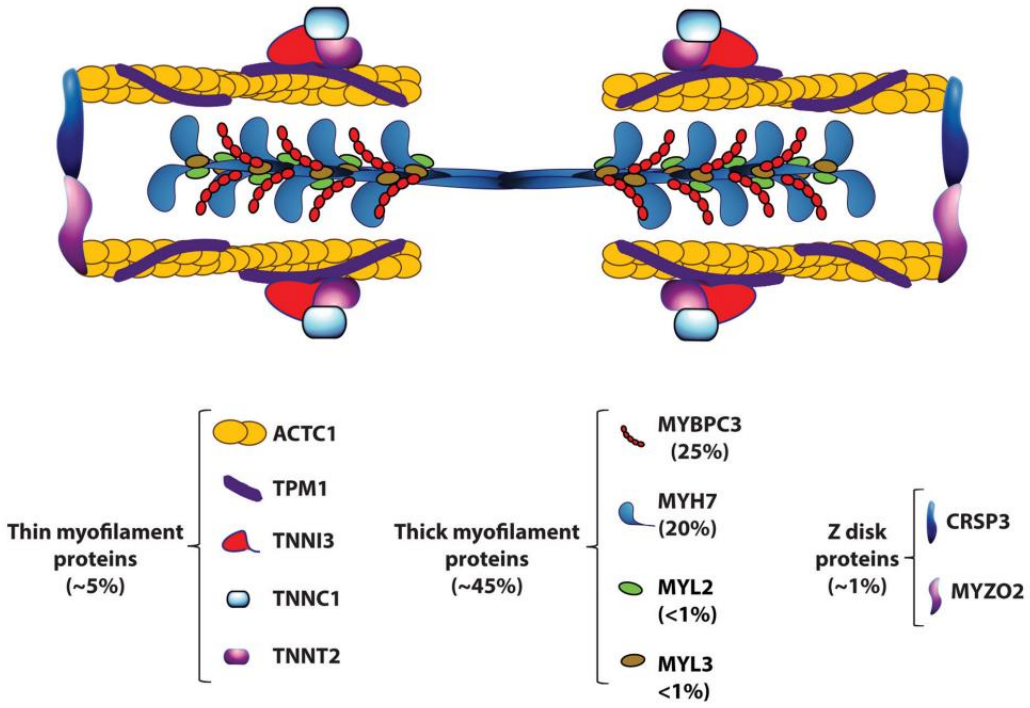
HCM – genetic disease of the sarcomere

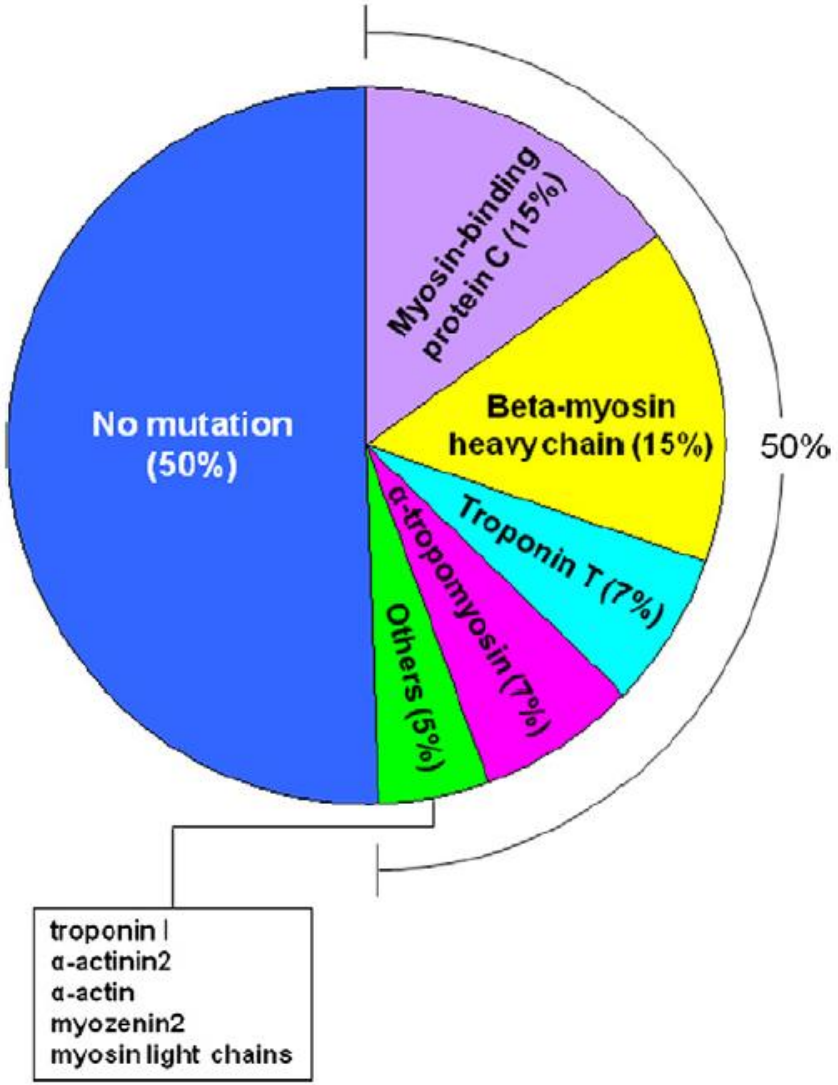


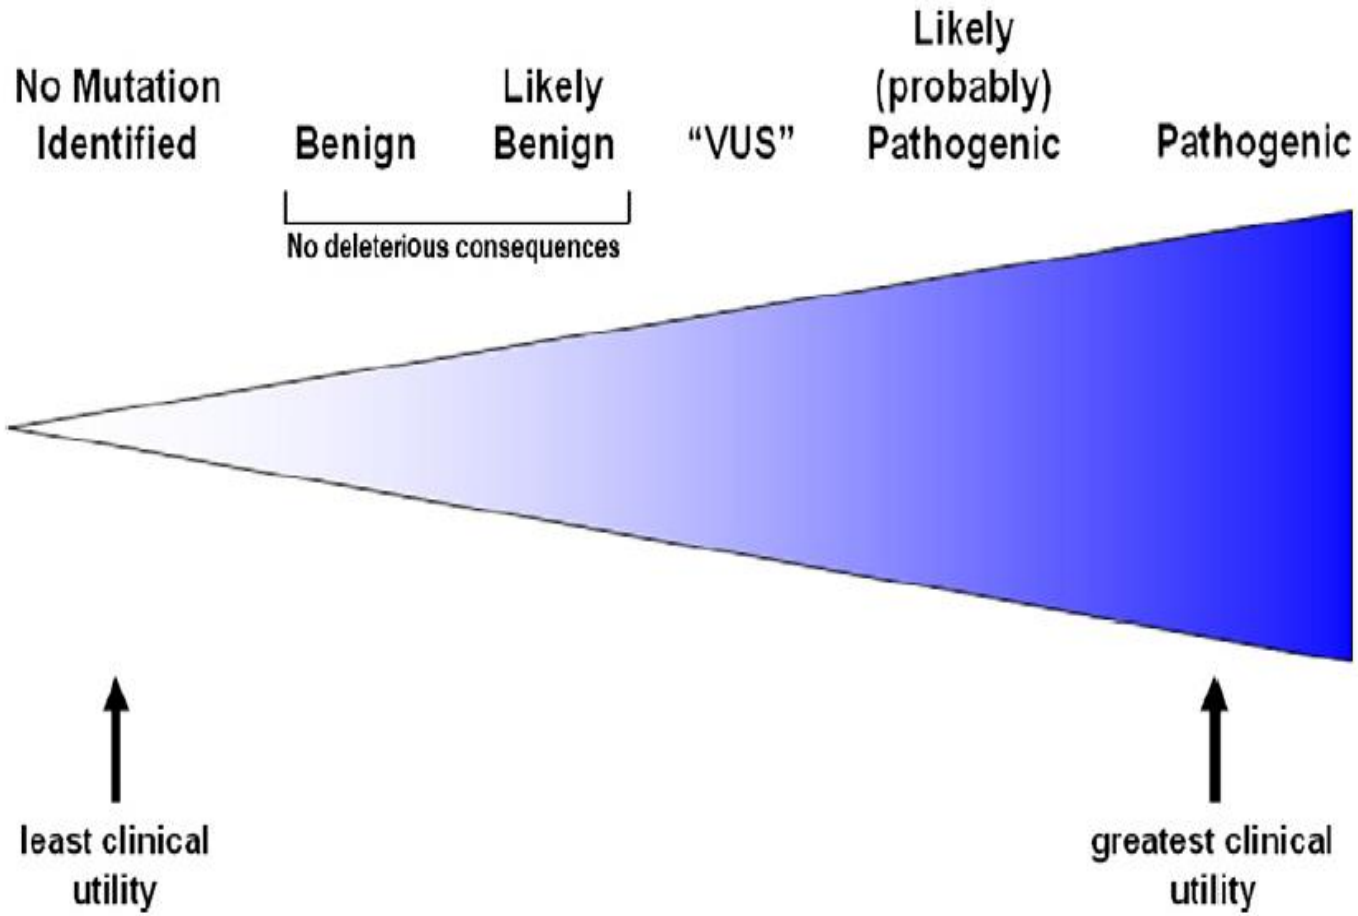
A. Established Causal Gene HCM (Large families)				
Gene	**Protein**	**Function**	**Tolerance to variation**	
			Missense (Z score)	**LoF (pLI)**
MYH7	β-Myosin heavy chain	ATPase activity, Force generation	6.54	0.00
MYBPC3	Myosin binding protein-C	Cardiac contraction	0.69	0.00
TNNT2	Cardiac troponin T	Regulator of acto-myosin interaction	1.54	0.01
TNNI3	Cardiac troponin I	Inhibitor of acto-myosin interaction	1.88	0.17
TPM1	α-tropomyosin	Places the troponin complex on cardiac actin	3.42	0.80
ACTC1	Cardiac α-actin	Acto-myosin interaction	5.25	0.95
MYL2	Regulatory myosin light chain	Myosin heavy chain 7 binding protein	0.86	0.02
MYL3	Essential myosin light chain	Myosin heavy chain 7 binding protein	0.75	0.89
CSRP3	Cysteine and glycine-rich protein 3	Muscle LIM protein (MLP), a Z disk protein	-0.66	0.00

B. Likely causal genes for HCM (small families)				
Gene	**Protein**	**Function**	**Tolerance to variation**	
			Missense (Z score)	**LoF (pLI)**
FHL1	Four-and-a-half LIM domains 1	Muscle development and hypertrophy	1.29	0.92
MYOZ2	Myozenin 2 (calsarcin 1)	Z disk protein	0.03	0.02
PLN	Phospholamban	Regulator of sarcoplasmic reticulum calcium	0.57	0.11
TCAP	Tcap (Telethonin)	Titin capping protein	0.45	0.08
TRIM63	Muscle ring finger protein 1	E3 ligase of proteasome ubiquitin system	0.02	0.00
TTN	Titin	Sarcomere function	−5.48	0.00

Marian and Braunwald Circ Res. 2017 September 15; 121(7): 749–770.

Is gene sequencing the ultimate solution?



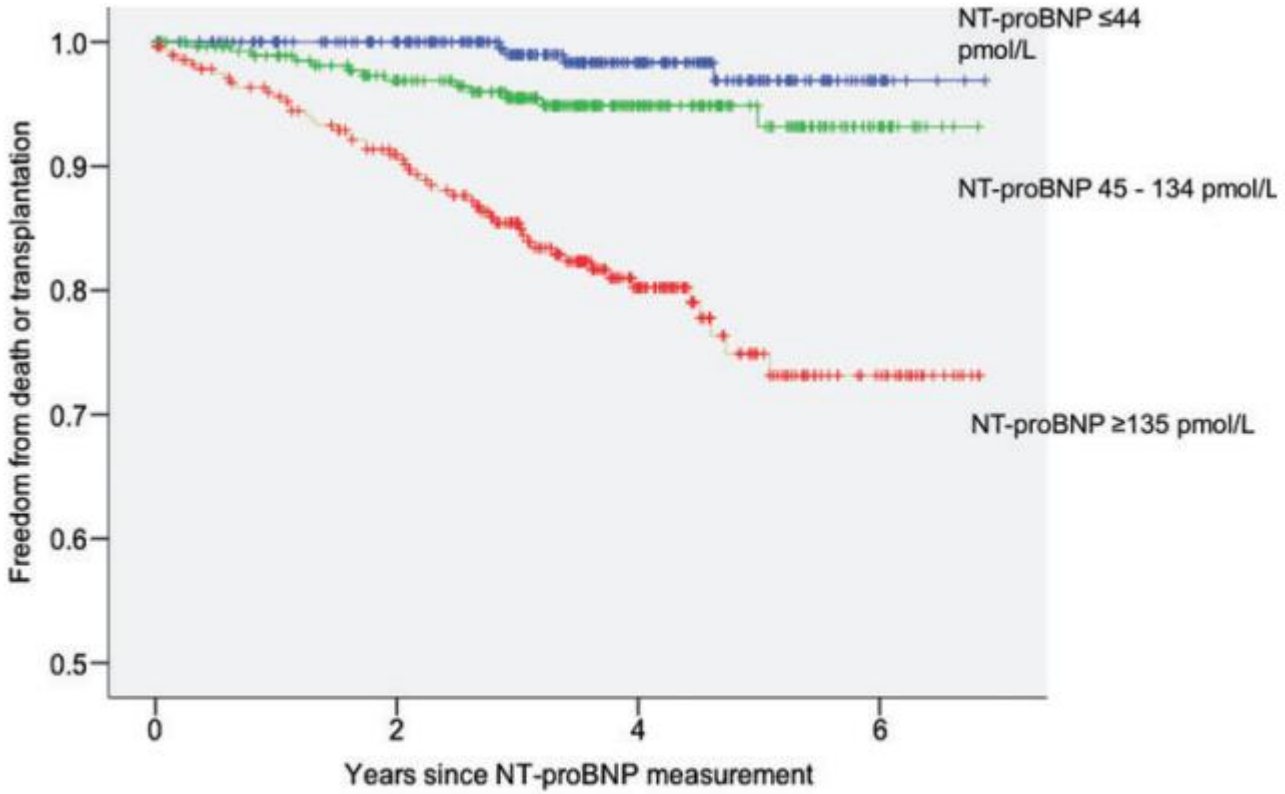


Maron B. et al. J Am Coll Cardiol 2012;60:705–15

STEP 5: RISK ASSESSMENT

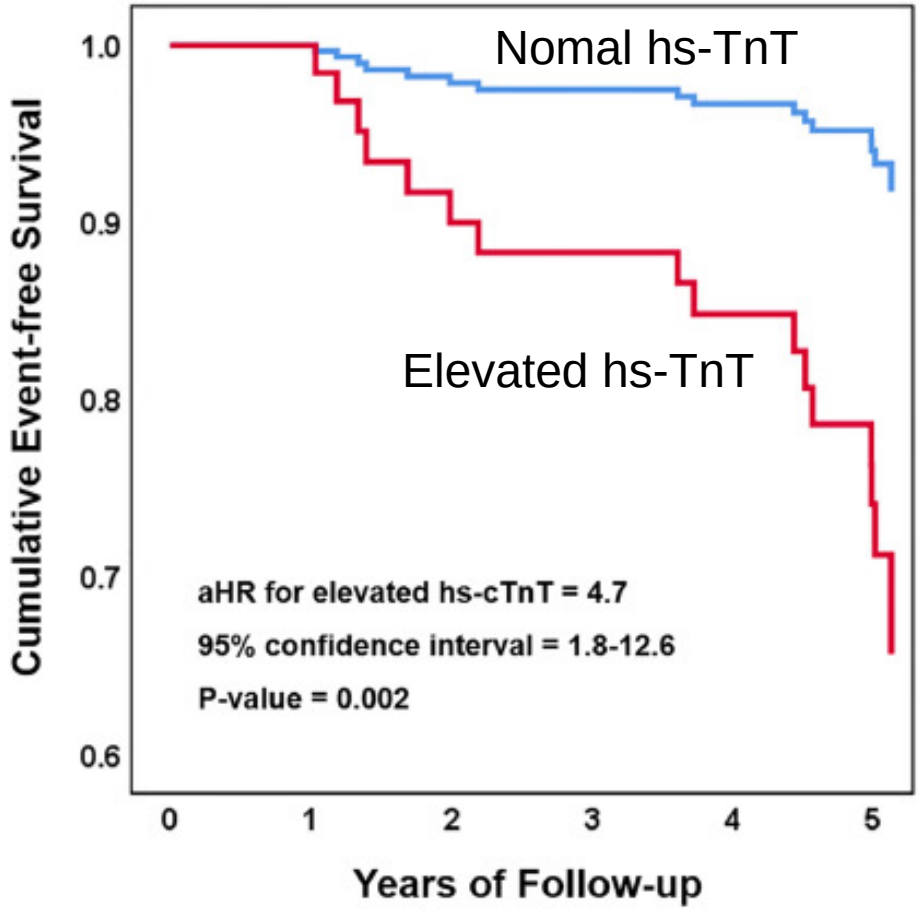
Prognostic implications of NT-proBNP and hs-Tn

847 patients (53+15 years; 67% male) with HCM (28% with LVOTO≥30 mmHg at rest) followed for 3.5 years



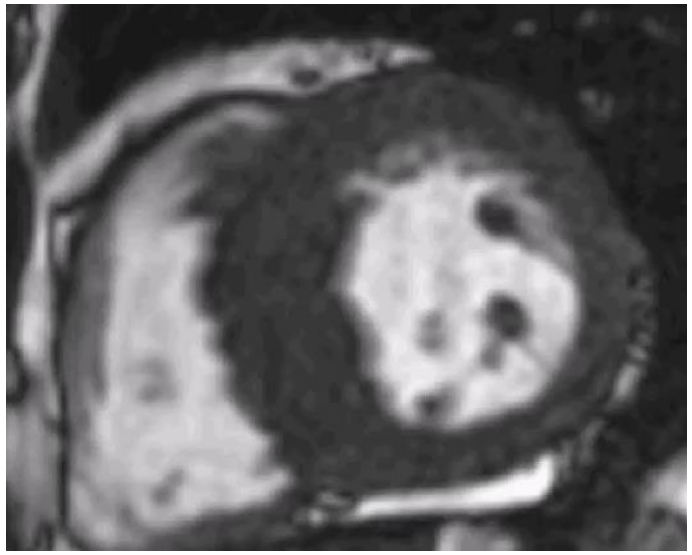
No. at risk				
NT-proBNP ≤44 pmol/L	284	238	106	11
NT-proBNP 45 - 134 pmol/L	281	229	96	16
NT-proBNP ≥135 pmol/L	282	225	100	21

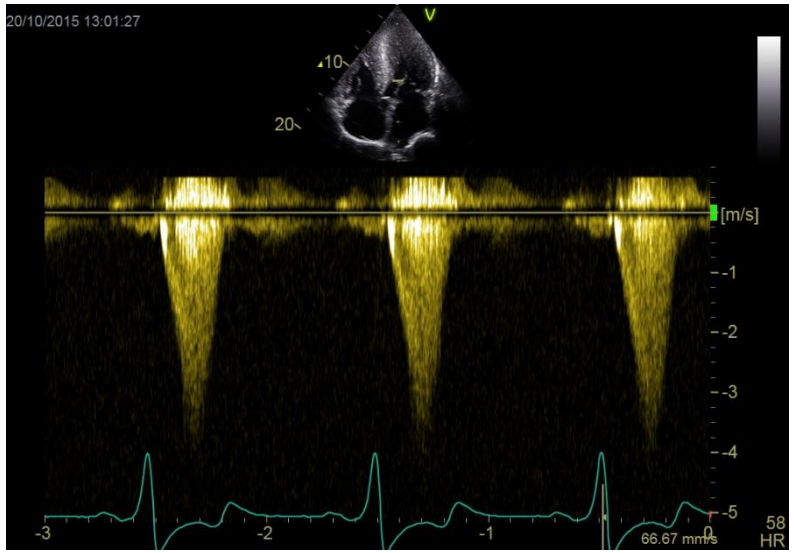
5-year follow-up cohort study of 135 HC patients
↑ hs-cTnT was present in 33 of 135 (24%) HC patients.

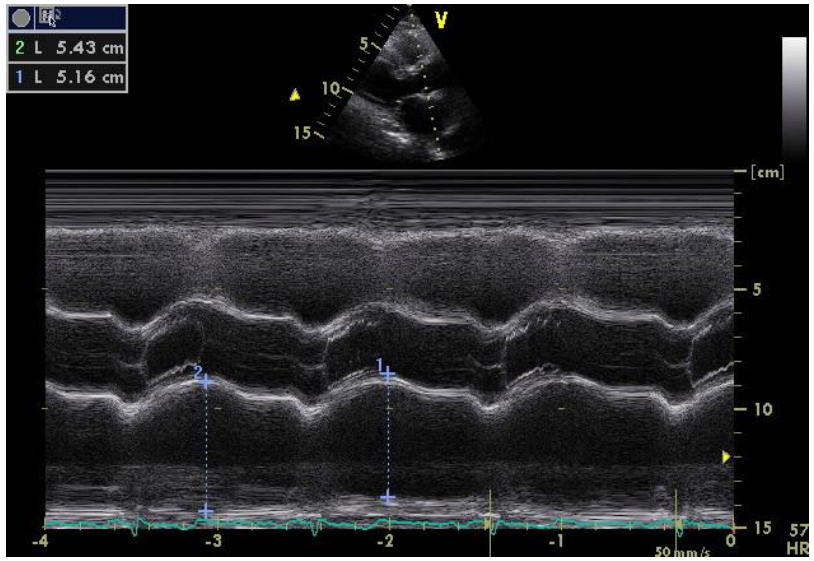


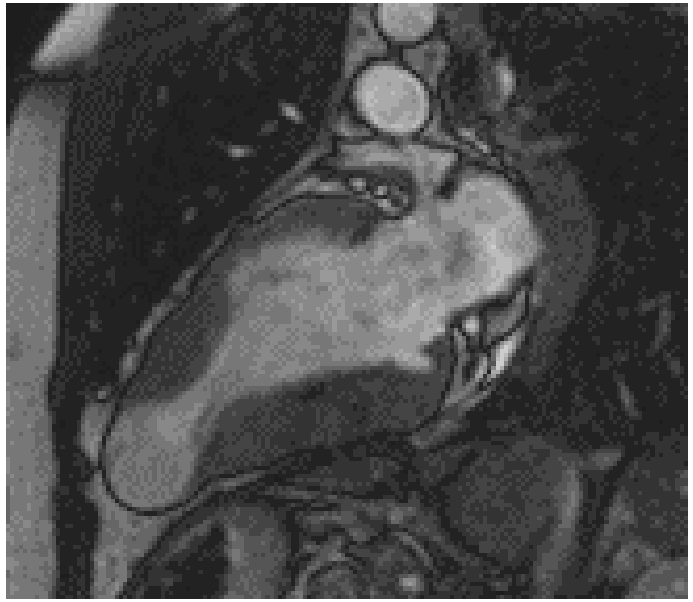
Coats C. et al. European Heart Journal (2013) 34, 2529–2537
Gommans FDH et al. JACC 2021;152:120-124

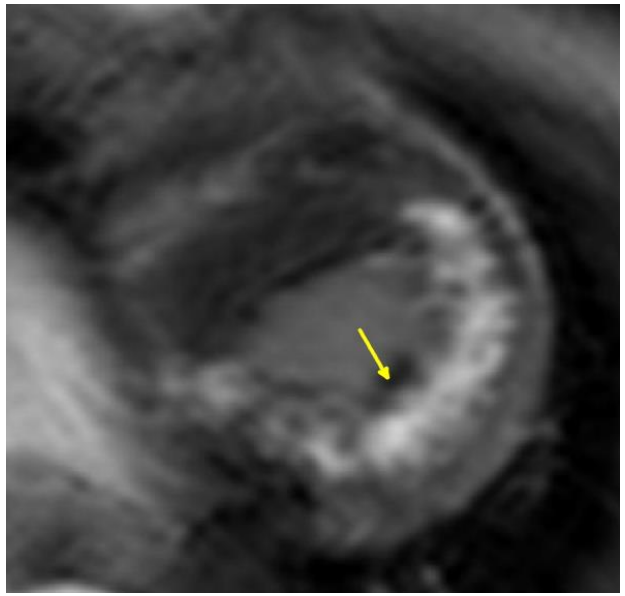
Prognostic implications of imaging

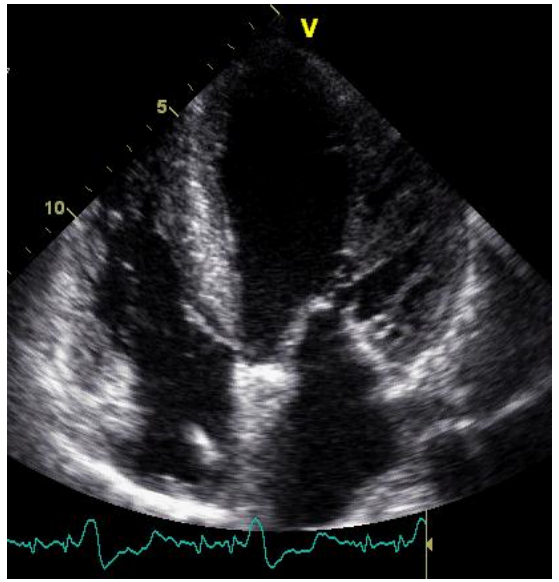






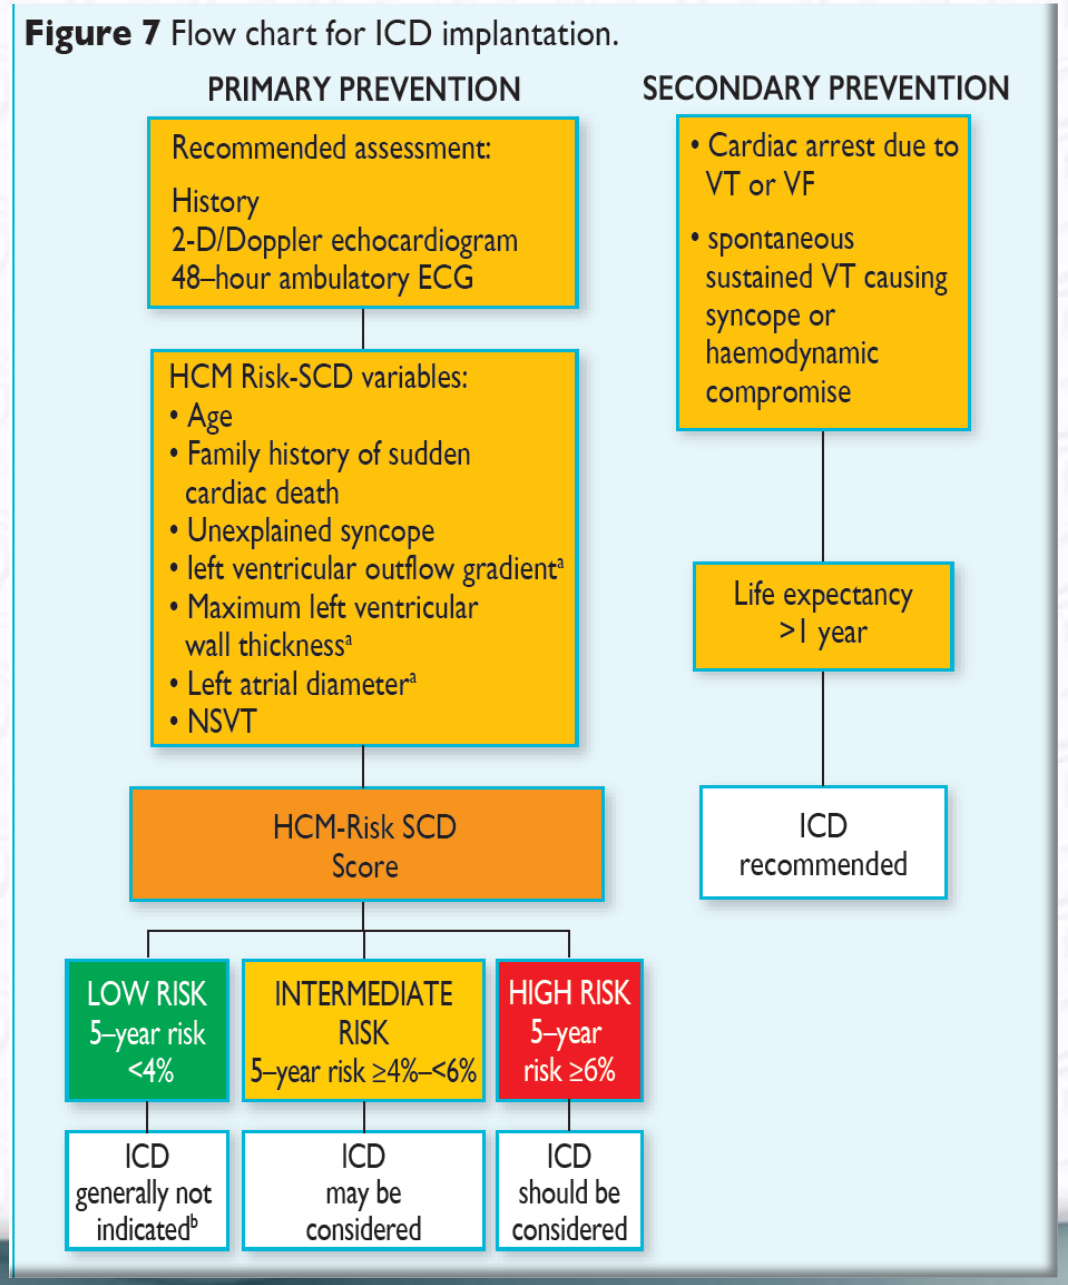






Imaging: General University Hospital Prague, CZ

2020 AHA/ACC Guideline for Diagnosis and Treatment of patients with HCM



Prevention of Sudden Cardiac Death

Recommendations for ICD in each risk category take into account not only the absolute statistical risk, but also the age and general health of the patient, socio-economic factors and the psychological impact of therapy.

European Heart Journal (2014):doi:10.1093/eurheartj/ehu284

SCD stratification

Family history of sudden death from HCM	Sudden death judged definitively or likely attributable to HCM in ≥1 first-degree or close relatives who are ≤50 years of age. Close relatives would generally be second-degree relatives; however, multiple SCDs in tertiary relatives should also be considered relevant.
Massive LVH	Wall thickness ≥30 mm in any segment within the chamber by echocardiography or CMR imaging; consideration for this morphologic marker is also given to borderline values of ≥28 mm in individual patients at the discretion of the treating cardiologist. For pediatric patients with HCM, an absolute or z-score threshold for wall thickness has not been established; however, a maximal wall that corresponds to a z-score ≥20 (and >10 in conjunction with other risk factors) appears reasonable.
Unexplained syncope	≥1 Unexplained episodes involving acute transient loss of consciousness, judged by history unlikely to be of neurocardiogenic (vasovagal) etiology, nor attributable to LVOTO, and especially when occurring within 6 months of evaluation (events beyond 5 years in the past do not appear to have relevance).
HCM with LV systolic dysfunction	Systolic dysfunction with EF <50% by echocardiography or CMR imaging.
LV apical aneurysm	Apical aneurysm defined as a discrete thin-walled dyskinetic or akinetic segment of the most distal portion of the LV chamber; independent of size.
Extensive LGE on CMR imaging	Diffuse and extensive LGE, representing fibrosis, either quantified or estimated by visual inspection, comprising ≥15% of LV mass (extent of LGE conferring risk has not been established in children).
NSVT on ambulatory monitor	It would seem most appropriate to place greater weight on NSVT as a risk marker when runs are frequent (≥3), longer (≥10 beats), and faster (≥200 bpm) occurring usually over 24 to 48 hours of monitoring. For pediatric patients, a VT rate that exceeds the baseline sinus rate by >20% is considered significant.
